

A POTENTIAL MARKET STUDY OF A DOMESTIC  
RECORD / DATA COMMUNICATIONS SERVICE

INPUT  
LIBRARY

## ABOUT INPUT

### THE COMPANY

INPUT provides planning information, analysis, and recommendations to managers and executives in the information processing industries. Through technology forecasting analysis, INPUT supports in making informed decisions. Services are provided to clients of computers, communications products and services.

The company carries out depth research. Two clients on important issues members analyze and interpret data, then develop recommendations. Innovative ideas to management. Clients receive reports access to data on which and continuous consulting services.

Many of INPUT's professionals have nearly 20 years in areas of specialization senior management positions marketing, or planning. This enables INPUT to supply complex business problems.

Formed in 1974, INPUT has become a leading international consulting firm. Clients include over 100 of the world's largest and most technically advanced companies.

A POTENTIAL MARKET STUDY  
OF A  
DOMESTIC RECORD/DATA COMMUNICATIONS SERVICE

**ABSTRACT**

Closed user message networks are multistation teleprinter networks with the majority of the traffic being between locations of the same company. Such networks implemented on the Telex/TWX network are the primary focus of this study. An estimated 12,000 stations of the total Telex/TWX population of 130,000 stations, are connected to closed user networks. The traffic volume among these stations is about 19 minutes per station per day, or about 75% higher than the 11 minutes per station per day which is the average for all stations on Telex/TWX. About 85% of the closed user network stations are located within the largest 100 metropolitan areas. This percentage is slightly higher than that of the Telex/TWX population. The primary alternative method of implementing these closed user networks is the telephone network using WATS tariffs and user owned control equipment such as message switchers. The most critical user requirement in implementing any closed user network is network reliability in a broad sense.

## I INTRODUCTION

## I INTRODUCTION

### A. OBJECTIVES

- It is the intent of this study to examine and define the market for a domestic record/data service being considered by ITT World Communications, Inc., within the United States. To this end, four specific objectives were established for the study:
  - To define and quantify the market for closed user network implemented on Telex/TWX. A closed user network is defined as a single company, multi-station network in which at least 75% of the traffic remains within the network.
  - To evaluate the primary alternative network solutions which are available to the users of closed networks. The principal factor to be evaluated is price, but other factors are also to be considered.
  - To evaluate the potential market acceptance which a new message network service would achieve among these users of closed networks.
  - To define the service requirements imposed by closed user networks with particular emphasis on the areas of:
    - . Geographic coverage.

- . Traffic volumes.
- . Sensitivity to price.
- . Equipment connection requirements.
- . Other message service interconnection requirements.

- It is necessary to establish the position of closed user networks in relationship to the other segments of the Telex/TWX marketplace with respect to both the relative sizes of these segments and the differing requirements of the closed user networks.
- To the extent possible, the interviews were to be conducted to give a representative geographic sample of the Telex/TWX population.

## B. RESEARCH METHODOLOGY

- Four separate tasks were established to accomplish these objectives:
- Task I: In-depth interviews.
  - A total of sixty on-site interviews were conducted with communication managers of Telex/TWX networks.
  - Fifty of these interviews were with current users. The other ten were with companies which had been users, but have recently discontinued their use of Telex/TWX in favor of another type of network solution.
  - These sixty interviews were conducted along the East Coast from Boston to Philadelphia, in Chicago and in San Francisco.

- The primary objectives addressed by the Task I interviews were:
  - . Definition of user requirements.
  - . Evaluation of new service acceptance.
- Task II: Sample survey of Telex/TWX population.
  - 201 telephone interviews were conducted with the Telex or TWX supervisors of a randomly selected sample of the Telex/TWX population.
  - The primary objectives addressed by the Task II interviews were:
    - . The segmentation and sizing of the Telex/TWX population.
    - . A definition of the traffic volume's requirements.
- Task III: Price analysis of alternative network services.
  - A hypothetical but representative network was defined and eight parametric variations were established, bracketing the common ranges of sizes and volumes for most closed user networks.
  - Each of six alternative network services were priced for the hypothetical network and its eight variations.
  - The six services compared were:
    - . TWX.
    - . DDD.
    - . WATS.

- . On-Tyme.
- . InfoCom.
- . Private wire system.

- The primary objective addressed by the Task III analysis was:

- . An evaluation of competitive price levels and structures.

- Task IV: An analysis of market distribution by geography.
- A sample of 100 companies with multi-station networks were selected at random from a larger sample of 331 such companies identified from the 1979 Telex/TWX directory.
- The station locations of these 100 company networks were identified first by city and then by Standard Metropolitan Statistical Areas.
- Eighteen of these 100 companies are also included in the fifty companies interviewed on-site, giving a cross check on the results.
- The primary objective addressed by the Task IV analysis was the definition of geographic distribution requirements.

- At the completion of these four basic tasks, the results were analyzed and compared against the plans proposed by ITT for the domestic record/data service. Conclusions were reached regarding the plans' market feasibility and regarding some specific features and capabilities to be offered as a part of the service.
- Finally, a set of recommendations was developed for consideration by ITT in furthering and, in some cases, modifying the plans for the domestic record/data service.

## II EXECUTIVE SUMMARY

## **II EXECUTIVE SUMMARY**

### **A. KEY CONCLUSIONS**

- A 12,000 station market exists in closed user networks implemented on Telex/TWX.
- This market is relatively available at present for a DR/DS type of service, but its availability will decline over the next few years due to its constituent companies finding other solutions.
- While the closed user network market is large enough and available enough for short-term, rapid growth, it is too small for longer term growth of the DR/DS.
- Larger and longer-term growth opportunities exist both within the Telex/TWX population as international access stations and also in other related message services.
- The traffic volumes within the closed user networks average about 19 minutes, or 5,000 characters per day.
- Closed user networks require service to substantially all of their network locations.

- This geographic requirement can be translated into a requirement to provide convenient and economical service access to approximately 100 metropolitan areas. A metropolitan area, for this purpose, is considered to be the city limits plus 20 miles. This extended area is particularly important for the large metropolitan areas such as New York, Chicago, and Los Angeles.
- Network reliability (meaning network availability, probability of connection, station uptime, failure restoral times, and many other factors) is the most important consideration in introducing a new service.
  - The unreliability of the Telex/TWX network is the most frequently stated reason for dissatisfaction.
  - Network reliability is the most important reason for considering conversion to another service.
- Alternative solutions exist and are being considered by many existing multi-station network users now on Telex/TWX.
- Future alternative solutions announced, such as Bell's ACS, tend to be more oriented to the data network market than to the message network applications.

## B. CONCLUSIONS

### I. MARKETS

- The Telex/TWX network connects a total of almost 130,000 stations.
- Of these, approximately 70,000 are unavailable to the DR/DS due to being used as:

- Access stations to other companies (40,000).
  - Supplementary stations on another network (24,000).
  - Non-chargeable stations (5,000).
- Of the remaining 60,000, the primary market being addressed (that of closed user networks) consists of a total of 12,000 stations.
- There is a secondary market addressable by DR/DS of almost 50,000 stations consisting of:
  - International access stations (46,000).
  - InfoCom networks (3,000).
- In addition to the potential markets for DR/DS, which are a part of Telex/TWX, there are additional message application markets, such as private wire systems and others, which could be available for DR/DS marketing. Many of these markets consist of networks which were once implemented on Telex/TWX. These tertiary markets include:
  - Small private wire systems (20,000).
  - Telephone based message systems (50,000).
  - USPS access stations (5,000).
  - Industry systems; e.g., DR (25,000).

## 2. TRAFFIC VOLUMES

- The average traffic volume per station of the entire Telex/TWX 130,000 station network is approximately 11 minutes per day.

- 7.5 minutes of this average are domestic usage. The other 3.5 minutes are international access outbound.
  - Telex usage, in minutes per day, is slightly higher than TWX.
- This traffic volume is made up of a message volume of eight messages per day at 400 characters per message, and an average transmission rate of 300 characters per minute.
- There are wide variations between the individual stations, but relatively little variation between large groups or segments of the Telex/TWX population.
- In the case of closed user networks, most of the stations which comprise these networks match the overall population averages for traffic volumes.
  - However, these closed user networks differ from the overall population in one important respect and that is the existence of a central station (or two or three). This central station is the receiving location for almost all network traffic originated at the other stations, and it transmits traffic back to the outstations at a volume approximately 75% of the volume received.
  - Thus, the average traffic volume for closed user networks is about 1.75 times the population average, or 19 minutes per station.
- While most of the traffic in a closed user network remains within the network (this is in fact the definition of a closed user network), it is important to note that there is usually some volume of off-net traffic which must be transmitted.
  - This off-net traffic averages about 5% of the total (again with wide variations).

- The destinations of this off-net or refile traffic are other message services such as:
  - . International messages.
  - . Mailgrams.
  - . Other companies' Telex/TWX stations.

### 3. GEOGRAPHY

- One of the most important requirements which closed user networks impose on a network service is service availability in all or substantially all of the user locations.
  - While users will make adjustments for low volume stations, one of their first selection criteria of a new service is the number of user locations served.
- Service availability in a message environment does not have the same level of "immediacy" as in a data or voice environment. If a message can be transmitted in less than an hour, without inconveniencing the user either in effort or cost, the service will be regarded as satisfactory. This opens many solution possibilities for providing service availability to remote and even low volume locations.
- Approximately 24% of the stations on large (11 or more) multi-station networks are located within the top 25 cities (ranked by population).
  - Forty percent of the stations are within the top 100 cities.

- If cities are defined as SMSAs (Standard Metropolitan Statistical Areas, or Standard Consolidated Statistical Areas in the case of the very large cities), the percentage of stations located within those geographic centers increases dramatically.
  - Largest 25 metropolitan areas - 50% of stations.
  - Largest 100 metropolitan areas - 73% of stations.
- Examining the large closed user networks, the percentage of stations within the largest 100 metropolitan areas is even higher - about 85%.
- Based on an estimate that closed network users will give serious consideration to a new service only if at least 80% of its locations are served, the conclusion is reached that a new message service must be made available in approximately 100 cities.

#### 4. VALUE ADDED FEATURES

- Value added features are not an important reason for closed network users to convert from their existing Telex/TWX network to another service.
- Such users are interested in, and willing to use and pay for, many value added features.
- Abbreviated dialing is regarded as the most useful value added feature discussed.
  - This level of importance has powerful implications for the ways in which service availability is provided to remote locations.
- On the other hand, mailbox delivery is regarded as the least useful.
  - This has very similar implications for remote access methods.

## 5. TERMINALS

- Terminals are regarded by users as an integral part of their networks. While most of them are willing to obtain these terminals from third parties (and many already do), they still consider a terminal failure to be a network failure, and slow maintenance response to be a factor of which the service supplier should be aware and over which it should have some control.
- Users also have definite ideas on needed terminal improvements, primarily in the areas of:
  - Editing capabilities.
  - Buffering capabilities.
  - Office environment acceptability (noise and appearance).
- If terminals are not provided by the service vendor, and most users do not require that they be, some guidance in their selection and some assistance in the control of their maintenance is expected of the service vendor.

## 6. NETWORK RELIABILITY

- As previously noted, network reliability is the most important consideration to the user in converting to any new service, and some means must be found to demonstrate the higher reliability of the new service.
- Network reliability means many things, simultaneously, to the network users.  
It means:
  - Availability of the basic network services to all stations.
  - Ability of any connection to be established in a reasonable time period.

- Operability of the terminal and its connection to the network (these two are largely undifferentiable by the operators).
- Rapid response and restoral times to any perceived failures, especially at the stations.
- Awareness of, and effective action on, any long time outage or persistent problem. This action is required of the basic service provider regardless of the source of the problem.
- On the other hand, network users are aware that failures do occur and accept some level of network outages.
- In addition, message system users do have other alternatives (e.g., voice telephone) as temporary fallback in case of failure.

## 7. COMPETITIVE ALTERNATIVES

- Because of the centralized nature of the closed user networks and their many-to-one traffic patterns, a significant amount of control of the network is usually performed at the central station.
  - This control may be manual or automated (e.g., some form of message switcher).
  - The larger the network, the higher the requirement for such control.
- The competitive alternatives fall into two categories:
  - Those with built-in central control capabilities.
    - . On-Tyme from Tymnet.
    - . InfoCom from Western Union.

- . Wilcom from Wiltek.
- Those without central control capabilities.
  - . Telex/TWX.
  - . Telephone network based systems (DDD or WATS).
  - . Dedicated line networks.
- WATS based networks are usually the lowest cost networks.
- On-Tyme is a very cost effective controlled network alternative, but it has very little off-net capability at present.
- Dedicated line networks only become cost effective in very large systems (100 or more stations) or in restricted geography networks.

### C. RECOMMENDATIONS

- The availability market for a domestic record/data service is of adequate size, relative to ITT's plans, to justify proceeding with the implementation of the service.
- Develop the primary market, that of closed user networks currently implemented on Telex/TWX, rapidly, taking advantage of a time window of user dissatisfaction. This current situation of user dissatisfaction will disappear in a few years as those users continue to find other solutions, as many previous users already have done.
- Prepare plans to define and develop the secondary and tertiary markets.

- The primary market, though capable of rapid market development, is too small to support the future growth of DR/DS.
- The network developed for the primary market is ideally suited to address:
  - . The secondary market, that of other Telex/TWX stations used for international access and for InfoCom.
  - . The tertiary market, that of other message networks, many previously implemented on Telex/TWX.
- Establish an experienced communications system sales force.
  - A limited number (perhaps 12 or less) of well-qualified and well-supported sales people could be much more effective in this primary market environment than a larger number of less qualified persons.
- Identify and qualify the customers who comprise the primary market.
  - The large closed user network market of 5,000 stations consists of about 125 users.
  - The small closed user network market of 7,000 stations consists of possibly 1,500 users.
  - The larger users are more dissatisfied than the smaller users and should be addressed first.
- Involve the prospective users in the planning of the DR/DS as soon as practicable.
  - The present situation represents a unique opportunity to allow customers to contribute to the detailed service specifications while

some details are still flexible, and, at the same time to commit themselves to becoming the initial revenue customers.

- The two dangers of such an approach are:
  - . User demands for unprofitable features. This will require some good negotiators to be on the ITT team.
  - . Possible cancellation of the entire project after user involvement. Users should not be involved until the DR/DS project has gotten to a point of high probability of completion.
- Provide service as conveniently and economically as possible to 100 or more locations.
  - Convenience implies that the operator, after preparing the message to be sent, can initiate transmission with minimal manual intervention. Specifically:
    - . No 10 or even 7 digit dialing.
    - . No call progress tone monitoring.
    - . No manually controlled answerback exchanges.
    - . No repeat dialing on busies.
  - Economical means that:
    - . For at least 25% of the stations (65% of the traffic volume), there is no user premium for a call.

- . For at least 80% of the stations (95% of the intracompany traffic volume), the maximum premium is local message units (approximately 10¢ per call).
  - . For all of the stations and all of the traffic volume, the user premium is a maximum of 30¢ per call.
- The following solution strategy is proposed, not as the necessarily appropriate solution, but rather as a further explanation of the requirements:
  - Dedicated line connections to all subscribers within the city limits of the 25 largest cities, and to central stations of user networks regardless of location.
  - FX lines to 75 additional cities as well as to approximately 100 suburbs locations around the 25 largest cities.
  - In WATS lines for all other stations.
  - A station controller at each telephone connected station which would do:
    - . Automatic dialing.
    - . Automatic redialing.
    - . Connection control.
- Implement network reliability-enhancing techniques in order to provide assurances to prospective users that DR/DS would be a much more reliable network than Telex/TWX.
  - These network reliability-enhancing techniques could include:

- . Diagnostic checks to all stations in off hours.
- . Centralized control of network operations and of maintenance functions, even those of third party terminal vendors.
- . Customer network managers designated and named to the customers for customer service.

- Establish close relationships with terminal providers in order to accomplish two critical customer service functions:
  - Availability of an appropriate array of network compatible terminals.
  - Common and acceptable levels of maintenance quality and of control of maintenance reporting, dispatching, and follow-up.
- Provide adequate interface capability with the DR/DS system so that a reasonable range of customer equipment and systems can be connected to the network.
- Provide a capability to refile messages out of the DR/DS network to other message services, particularly:
  - International Telex.
  - Telex/TWX stations of other companies.
  - Mailgram.

### III NETWORK USER ANALYSIS

### III NETWORK USER ANALYSIS

#### A. MARKETS

##### I. TELEX/TWX MARKET SEGMENTATION

- At the end of 1978, there were 121,300 Telex/TWX stations in service.
  - Of these, 54,000 were TWX and 67,000 were Telex.
- Telex/TWX has been growing at a 5% AAGR, which would put the total number of stations as of mid February 1980, at about 128,000 (or nominally 130,000).
- Based on the telephone survey of 201 Telex/TWX stations taken at random and extrapolating this sample to the entire Telex/TWX population, the market was segmented into the categories and sizes shown in Exhibit III-1.
- Intra-company stations were defined as those stations with 75% or more of their traffic remaining within the network. All others were considered to be outside access stations.
  - It is interesting to note that the users studied, both in the telephone survey as well as the on-site survey, fell neatly into two groups:
    - . Mostly intracompany traffic.

**EXHIBIT III-1**  
**TELEX/TWX MARKET SEGMENTATION**

Total number of stations	130,000
Outside access stations	86,000
Single stations	63,000
Domestic access	29,000
International access	34,000
Two to ten stations	17,000
Domestic access	8,000
International access	9,000
Eleven or more stations	6,000
Intra company stations	36,000
Two to ten stations networks	21,000
Supplementary stations	14,000
Closed networks (NOTE I)	7,000
Eleven or more station networks	15,000
Supplementary stations	10,000
Closed networks	5,000
Miscellaneous stations	8,000
Info Com	3,000
Non-chargeable	5,000

NOTE I: Supplementary/closed split was not tested but was assumed to be the same as larger networks.

- . Mostly extracompany traffic.
- This bi-model distribution can be observed in Exhibit III-2.
- Outside access stations were further divided into domestic access or international access. As shown in Exhibit A-1, a sizeable percentage of stations have more than 80% of their traffic intended for overseas stations.
- Intra-company stations were divided into supplementary stations and closed networks. A supplementary station is located at a very remote or low volume location on a network in which the user has another primary message system. The data to perform this split were derived from the on-site interviews and can be seen in Exhibit A-3.
- Finally, the non-listed stations, specifically those used for InfoCom Class 3 and 4, and other non-chargeable stations were subtracted from the total count of 130,000 stations.

## 2. MARKET POTENTIAL FOR DOMESTIC RECORD/DATA SERVICE

- This market potential is shown in Exhibit III-3.
- The primary market which represents a potential for DR/DS is that of closed user networks implemented on Telex/TWX.
  - These data were derived from Exhibit III-1.
  - The total size of this primary market is 12,000 stations.
- The secondary market consists of other available segments of the Telex/TWX population. These were considered to be:
  - The international access stations.

## EXHIBIT III-2

## PERCENTAGE OF MESSAGE TRAFFIC WITHIN THE COMPANY

PERCENT	TELEPHONE SURVEY		ON-SITE SURVEY	
	NUMBER OF COMPANIES	PERCENT OF COMPANIES	NUMBER OF COMPANIES	PERCENT OF COMPANIES
95-100%	21	10.4%	16	27%
85-95	31	15.4	1	2
75-85	6	3.0	3	5
65-75	8	4.0	2	3
55-65	4	2.0	0	0
45-55	18	9.0	2	3
35-45	2	1.0	1	2
25-35	1	0.5	2	3
15-25	9	4.5	5	8
5-15	9	4.5	8	13
0-5	92	45.8	20	33
TOTAL	201	100.0%	60	100%

EXHIBIT III-3  
MARKET POTENTIAL FOR DOMESTIC RECORD/DATA SERVICE

	<u>NUMBER OF STATIONS</u>
● Primary Market	
- Closed user networks implemented on Telex/TWX	
. Large users (11 or more stations)	5,000
. Small users (2 to 10 stations)	<u>7,000</u>
TOTAL	12,000
● Secondary Markets	
- International access	46,000
- InfoCom	<u>3,000</u>
TOTAL	49,000
● Tertiary Markets	
- Small private wire systems	20,000
- Telephone based message systems	50,000
- USPS access	5,000
- Industry systems (e.g. RR)	<u>25,000</u>
TOTAL	100,000

- The InfoCom stations.
- Domestic access and supplementary stations are regarded by INPUT as unavailable to DR/DS because of a lack of competitive advantages relative to their existing network.
- The tertiary market consists of other message system markets which are now in place and are likely to be available to DR/DS.
  - Many of these markets are made up of networks which were once implemented on Telex/TWX but have already moved to these other alternatives.
  - Small private wire systems are those under 100 station networks. Larger networks are regarded as unavailable.
  - Telephone based message systems are similar to small private wire systems in that most were at one time a Telex or a TWX network.
  - USPS access are those stations which are installed primarily for access to the Mailgram service. The 3,000 Western Union Electronic Mail, Inc., terminals constitute the bulk of these stations.
  - The special industry networks are often private wire systems but increasingly telephone connected. They include networks which inter-connect railroads, motel reservation systems, etc.
- The tertiary market, while sizeable, is difficult to quantify and to identify. The numbers used are INPUT estimates of the respective segments.
- Not included in the DR/DS market potential were two additional classes of message market segments:
  - Specialty segments such as facsimile.

- Future segments such as communicating word processor networks or electronic mail.

### 3. LARGE CLOSED USER NETWORKS

- The segment of the primary market designated "large closed user networks" is considered to be of prime and urgent importance to the market development of DR/DS.
- This 5,000 station segment is immediately addressable:
  - Twenty-five percent of the companies are dissatisfied with Telex/TWX and also are considering making a network change.
  - These 25% are the largest companies and represent 50% of the stations.
- There are only 125 companies which make up this urgent segment and they are all listed in the Telex/TWX directory.
- The closed user networks tend to be even more centrally located than other multi-station networks. Eighty-five percent of the closed user networks are located in the largest 100 metropolitan areas, whereas for all multi-station networks the number was 73%.

## B. TRAFFIC VOLUMES

### I. TELEX/TWX NETWORK TRAFFIC

- In 1978, Western Union obtained \$143 million in usage revenue from the 117,500 Telex/TWX stations in service as of mid 1978.

- This equates to \$1,217 per station, or \$101 per month, or \$4.61 per working day.
- Dividing this figure by the known average of about 45¢ per minute, an average daily traffic of just over 10 minutes can be derived.
- This correlates well with FCC reported data indicating an average daily traffic of 7.5 minutes domestic and 3.5 minutes international on Telex and slightly less on TWX.
- This also correlates well with the data from the telephone interviews and the on-site interviews of this study which indicate an average traffic volume of about 11 minutes.
- The methodology used in the traffic volume portion of the two surveys was designed to detect differences in traffic volumes between various segments of the Telex/TWX markets, not to define traffic volumes directly.
  - In a number of interviews there is sufficient information to develop actual traffic volumes. It is these interviews which correlate well with system averages.
- The surveys, primarily the telephone survey, show no significant difference in traffic volumes between groups of stations representing the various segments of the marketplace.
- The two primary items of data collected are messages per day and lines per message.
- In all segments, these average:
  - 8 messages per day.
  - 14 lines per message.

- The variation is wide between individual stations and networks.
  - The estimated number of messages per day ranges from 0.2 to 100.
  - The estimated number of lines per message ranges from 3 to 45.
- From other data and a limited number of samples, it is estimated that the average line length is 30 characters and the average transmission rate is 300 characters per minute. This data can then be reduced to:
  - 3,300 characters per day per station.
  - 11 minutes transmission time per day per station.

## 2. CLOSED USER NETWORK TRAFFIC

- The stations on closed user networks generate the same volume of traffic as all other types of stations, that is, 11 minutes per day.
- There is, however, one significant difference in closed user networks and that is the traffic pattern.
- Effectively all of the traffic originated at an out station in a closed user network is destined for one or very few central locations.
  - Usually these central locations are headquarters, or an order department, or the main plant, etc.
- All of the traffic sent to these central locations generates additional traffic back to the outstations.
  - Order confirmations, shipping dates, policy verifications, etc.

- The volume of this traffic from the central stations back to the outstations is approximately 75% of the volume of incoming traffic to the central station.
- Although there are relatively few of these central stations on the Telex/TWX network (one per closed user network), the high volumes which they generate bring the average traffic volume for all closed user network stations up to 19 minutes per day.

## C. GEOGRAPHIC REQUIREMENTS

### I. AVAILABILITY CONSIDERATIONS

- Closed user networks exist in order to provide some reasonably well defined communication applications to the remote locations of the user company.
  - These applications must be provided in some way to all user locations regardless of remoteness or other considerations.
  - Users with substantial numbers of remote outstations, or even a few, are intimately familiar with the problems of providing service to such locations.
  - The ability of a message service to provide the application capability to all stations is one of the key measures of its potential acceptability.
- Message services are somewhat unique among communications services in the requirements imposed by the user applications.
  - Urgency is much less of a consideration. Message delivery times in the one hour range are highly acceptable in most cases. Immediate interactive connection is rarely necessary from an application point of view.

- Operator ease of use and system economics are much more important considerations than urgency.
- The combination of the above two points open many possible solutions for remote locations. Usually these solutions will encompass some combinations of:
  - Dial up telephone connections.
  - Local buffering of outgoing messages at the station.
  - Storage and forwarding of messages through the network.

## 2. METROPOLITAN AREA COVERAGE

- By examination of the Telex/TWX directory, 331 companies with 10 or more stations were identified. These companies are listed by SIC code in Appendix D.
- Of these, 100 companies were selected at random and their geographic locations examined in detail.
  - Eighteen of these companies were among the sixty companies interviewed on-site.
  - These companies are listed in Exhibit C-3.
- From the 3,649 locations operated by those 100 companies, a distribution was made within the top 100 metropolitan areas.
  - A first estimate was made within the cities.
  - A second estimate was made within the metropolitan area.

- The summary of the results of these two estimates is shown in Exhibit III-4.
- A listing was prepared of the metropolitan areas in population sequence, allowing for standard consolidated areas in the largest cities. This listing is shown in Exhibit C-1.
  - The distribution of stations for the 100 company sample was made for that set of metropolitan areas. This distribution is shown in Exhibit C-2.

### 3. SUBURBAN COVERAGE

- There is a significant difference between providing service to the city and providing service to the metropolitan area in terms of number of stations served of multi-station networks. This difference is more than a factor of two among the largest cities as shown in Exhibit III-4.
- The suburbs of large cities are defined by the Standard Metropolitan Statistical Areas for purposes of this study. In the very largest cities there is a higher level, that of Standard Consolidated Statistical Areas, which for New York, for example, includes other SMSAs such as Newark, Paterson, etc.
- In order to provide the coverage needed for closed user networks, these suburbs need to be served economically and conveniently.
  - In New York, this probably means providing service to about eight suburban locations.
  - In Denver, this probably means providing service to two suburban locations.

EXHIBIT III-4

GEOGRAPHIC DISTRIBUTION  
OF TELEX/TWX TERMINALS

METROPOLITAN AREAS	PERCENTAGE OF LARGE NETWORK STATIONS	
	INCLUDING SUBURBS	NOT INCLUDING SUBURBS
LARGEST 25	50%	24%
LARGEST 100	73%	40%(est)

## D. VALUE ADDED SERVICES

### I. SURVEY RESULTS

- Multi-station network users interviewed on-site were presented with twelve possible value added features and asked to rate them in terms of "very useful", "useful," or "not useful."
  - Rating these responses 2, 1, and 0, respectively, the composite scores are shown in Exhibit III-5.
- Abbreviated dialing was the most useful feature, indicating a need for operator ease and convenience, a consideration which appears frequently in this report.
- Users were also asked to evaluate the additional price they would be willing to pay for these features, if any.
  - In most cases they would be willing to pay more.
  - On average, the increment is about 8%.
  - Many users would prefer that the cost of the value added features be built into the cost of the basic service.
- Users also indicated that while they would be interested in value added features and, in general, would be willing to pay for them, such features are not an important reason to convert to a new service.

### 2. INTERPRETATION OF USER REQUIREMENTS

- While there was good overall interest in all of the value added features, some, such as mailbox delivery and station polling, were lower than the others.

**EXHIBIT III-5**  
**VALUE ADDED FEATURES**  
**CONSIDERED USEFUL BY RESPONDENTS**

<u>FEATURE</u>	<u>COMPOSITE RATING</u>
Abbreviated dialing	93
Camp-on	67
Multiple address	71
Group codes	63
Station polling	51
Mailbox delivery	44
Automatic service upgrade	65
High speed interface	71
Other service interface	72
T&C call billing	73
Departmental billing	61
Message formating	65

- Rating system.

- Very useful 2\*
- Useful 1\*
- Not useful 0\*

\* Times 60 respondents = 0 to 120.

- Much of this difference can be attributed to a lack of any such features on the market today, and therefore a lack of understanding of their potential utility on the part of the respondents.
- The more understandable and/or the more currently available features drew the highest ratings.

## E. TERMINALS

### I. AVAILABILITY

- To a user, whether of multiple stations or a single station, the terminal is not only an integral part of the functional capability of the service, but it is also the most visible part.
- A separation of the availability of the service from that of the terminal, while conceptually acceptable to users, and in fact implemented by quite a few users, requires a level of system sophistication and self confidence which relatively few smaller users possess.
- If, as planned, ITT does not offer terminals, this will be acceptable to users only if they can be assured that appropriate terminals are truly available and if they are aided in their selection of terminals and terminal vendors by the service provider.
- In addition, the users will be looking to the service provider for assistance in the management of terminal maintenance situations.

### 2. FEATURES

- Most existing Telex/TWX users have a familiarity with teletype terminals.

- Relative to their experience with these units, users are looking for:
  - Better buffering capability.
  - Better editing capability.
  - CRT displays.
  - More quiet, improved appearance devices.

## F. NETWORK RELIABILITY

### I. DISSATISFACTION WITH TELEX/TWX

- A large number of multi-station users of all types expressed great dissatisfaction with their Telex/TWX operations, particularly with respect to network reliability issues.
- This dissatisfaction was expressed in three ways:
  - Direct question.
    - . Satisfied, 63%.
    - . Dissatisfied, 37%.
  - Level of Satisfaction - Scale of 0 (dissatisfied) to 12 - 5.6 average.
  - Planning to change - 28%.

## 2. INCENTIVE TO CONSIDER NEW MESSAGE SERVICE

- Practically all users would consider any new message service.
- Many, particularly the ones who are either dissatisfied with Telex/TWX, or planning to change, or both (these total about 50% of the respondents), would consider a new service very seriously.
- The factors which would be of importance to multi-station users in converting to a new service are as follows (scale is 0 to 3, unimportant to very, very important):
  - Network availability 1.9
  - Geographic coverage 1.7
  - Ease of use 1.7
  - Price 1.6
  - Value added features 1.3
  - Network management 1.2

## 3. INTERPRETATION OF USER REQUIREMENTS

- While the number of dissatisfied users does not appear high, nor does the level of dissatisfaction, it often turned out in the interviews that the users expressing satisfaction with Telex/TWX early in the interviews gave it lower grades on specific considerations later in the interviews.
- In addition, the comments made to the interviewer indicate a distinct pattern of decline in the levels of satisfaction.

- The long standing process of network users converting to other types of network services continues and very likely is accelerating.

## **IV EVALUATION OF COMPETITIVE ALTERNATIVES**

## IV EVALUATION OF COMPETITIVE ALTERNATIVES

### A. PRICING ANALYSIS

#### I. STRUCTURE OF THE PRICING MODEL

- The most objective comparison between alternative network communications services is a pricing analysis.
- In this study, a model network was defined with locations, traffic volumes, and patterns, etc.
  - Key parameters of the model network, such as number of stations, transmission speed, traffic volume, etc., were varied to bracket the likely ranges of networks to be addressed by the DR/DS.
  - The basic model and eight such variations were then priced for each of six different existing alternative services.
- The basic model network definition is as follows:
  - Fifteen major cities:
    - . New York City.
    - . Chicago.

- . Los Angeles.
- . Philadelphia.
- . Detroit.
- . San Francisco.
- . Washington, DC.
- . Boston.
- . St. Louis.
- . Pittsburgh.
- . Houston.
- . Minneapolis.
- . Cleveland.
- . Atlanta.
- . Denver.

- Ten secondary cities:

- . Akron.
- . Hartford.
- . Raleigh.

- Jacksonville.
- Nashville.
- Oklahoma City.
- Phoenix.
- Spokane.
- Stockton.
- San Diego.

- Traffic volumes.

- Five messages per day per station.
- Three hundred characters per message.

- Other definitions.

- 110 bits per second unless otherwise noted.
- All traffic went to New York City (no return traffic volumes were calculated).
- Cost of terminal equipment and central station hardware was not included.
- All stations sent the same volume of traffic.

● The parameter variations are as follows:

- Double the number of cities (additional 25 not named).
- Double the number of messages per day.
- Double the length of messages.
- Change the transmission speed to 120 characters per second.
- At 120 cps, batch the traffic into one message.
- Quadruple the number of messages per day and the length of messages.
- Transmit this new traffic volume at 120 cps.
- Batch transmit this new traffic volume at 120 cps.

- The basic model, the parameter variations, and the monthly traffic volumes per station and per network are shown in Exhibit IV-1.

2. RESULTS OF THE PRICING MODEL

- As shown in Exhibit IV-2, for some of the variations the price range between different services is as much as ten times.
- Generally speaking, the circuit switched services (TWX, DDD, and WATS) are less expensive than the store and forward services (On-Tyme and InfoCom).
- The private wire solution is clearly not appropriate for this model or any of its variations. A shorter mileage, regional network, or a significantly higher traffic volume network would show PWS in a better relative position but probably still not the most economical alternative.
- WATS shows up as the least cost alternative even if an estimated \$500 per month is added for a message switching capability at the central location.

## EXHIBIT IV-1

## BASIC NETWORK AND VARIATIONS

#	CITIES	MESSAGES (PER DAY)	MESSAGES (CHARS.)	SPEED (CPS)	MIN./MESSAGE	CHAR. (1,000)	VOLUME SUMMARIES				
							PER STATION PER MONTH	MESSAGES	MINUTES	CHAR. (1,000)	MESSAGES
BASIC	25	5	300	10	0.5	33	110	55	825	2,750	23
1	(50)	5	300	10	0.5	33	110	55	1,650	5,500	46
2	25	(10)	300	10	0.5	66	220	110	1,650	5,500	46
3	25	5	(600)	10	1.0	66	110	110	1,650	2,750	46
4	25	5	300	(120)	0.04	33	110	4.6	825	2,750	1.9
5	25	(1)	1,500	120	0.2	33	22	4.6	825	550	1.9
6	25	(20)	(1,200)	10	2.0	528	440	880	13,200	11,000	367
7	25	20	1,200	(120)	0.16	528	440	73	13,200	11,000	31
8	25	(1)	24,000	120	3.3	528	22	73	13,200	550	31

## EXHIBIT IV-2

## PRICING ANALYSIS OF ALTERNATIVE SERVICES

NUMBER	VARIATIONS				PRICE OF SERVICES PER MONTH					
	CITIES	MESSAGES (PER DAY)	MESSAGES LENGTH (CHARS.)	SPEED	TWX	DDD	WATS	ON-TIME	INFOCOM	PWS
B	25	5	300	10	\$1,688	\$1,732	\$896	\$1,392	\$1,976	\$6,487
1	50	5	300	10	3,377	3,465	1,732	2,685	3,363	11,927
2	25	10	300	10	2,964	3,052	1,319	2,272	2,800	6,487
3	25	5	600	10	1,688	1,732	1,319	1,392	2,800	6,487
4	25	5	300	120	N/A	1,732	658	1,388	2,131	7,054
5	25	1	1,500	120	N/A	676	658	699	2,131	7,054
6	25	20	1,200	10	10,620	9,432	7,113	6,369	8,420	6,987
7	25	20	1,200	120	N/A	5,692	1,043	5,621	8,350	7,054
8	25	1	24,000	120	N/A	1,237	1,043	1,405	8,350	7,054

- WATS is particularly advantageous when the transmission rate goes to 120 cps.
- On-Tyme is a powerful alternative in spite of the complex price structure.
  - Like WATS, it becomes more powerful at higher speed.
  - Unlike WATS, On-Tyme shows significant advantages when messages are batched.

## **B. ANALYSIS OF EXISTING ALTERNATIVES**

- Over and above price, the other factors which could differentiate the various services are:
  - Network reliability.
  - Other message service interconnection.
  - Other equipment interconnection.
- On network reliability, much has already been said about TWX. InfoCom suffers from some of these same problems.
  - DDD and WATS are implemented on the highly reliable telephone network.
  - PWS network reliability is largely a function of the user's ability to manage his own network.
  - For On-Tyme, there are no available data.

- On other message service interconnection, such as international Telex, other companies' stations, and Mailgram, only two Western Union services have such a capability today. Those networks with a private message switcher, such as WATS based networks, could easily implement such interconnection.
- On other equipment interconnection such as high speed terminals and high speed computer connections, only On-Tyme has such a capability at present.
  - While this capability does not present a major deficiency to the other networks at present, it is certainly a consideration in the mind of any prospective user.
- With respect to future expectations of change among these alternatives:
  - TWX is now in the throes of a huge cutover to an all-WU plant. Once completed, the reliability problems should decline.
  - DDD/WATS/PWS will remain structurally unchanged. However, new central station equipment which can perform powerful functions in a network are becoming more widespread and may make these services, especially WATS, more attractive.
  - On-Tyme is a relatively new service. As it becomes better known it may pick up steam and penetrate more of the network market.
  - InfoCom has been falling behind in relative capabilities versus On-Tyme and dedicated switchers. Perhaps when WU gets over the TWX cutover program, more attention will be paid to this relatively powerful service.

## C. EXPECTATIONS OF FUTURE ALTERNATIVES

- While most of the new communications services being planned in the United States are oriented toward data applications, some, particularly Bell's Advanced Communications Service, can be used very effectively in message applications.
  - Until the rates are defined for such services, they are impossible to evaluate against the existing alternatives.
- Of perhaps greater consequence than new services as a competitive impact on DR/DS is the possible impact of new terminal and central station equipment, particularly the following:
  - The switcher type devices, such as Sidereal, which can be used for controlling multiple lines, both sending and receiving, buffering between lines, and performing a high volume message preparation function.
  - The intelligent terminals which, with declining prices, can be used very effectively as high operator efficiency outstation terminals.
  - The communicating word processors which may be called upon to take over the Telex/TWX function in smaller locations.
- These and other new hardware developments in conjunction with the already demonstrated economic advantages of the WATS tariffs may bring some interesting new systems into being.
  - Intelligent devices at central stations and at outstations, operating at high speed over WATS lines, are very likely the most powerful source of competition for some time to come.

## **APPENDIX E: QUESTIONNAIRES**

DATE \_\_\_\_\_

GOOD MORNING/AFTERNOON, MY NAME IS \_\_\_\_\_ AND I  
REPRESENT INPUT INC., AN INDEPENDENT RESEARCH FIRM CURRENTLY  
CONDUCTING A STUDY OF THE COMMUNICATIONS INDUSTRY. WE HAVE SELECTED  
YOUR FIRM NAME AT RANDOM FROM THE TELEX/TWX DIRECTORY TO HELP US IN  
OUR STUDY. MAY I HAVE YOUR HELP IN TALKING TO THE PERSON MOST  
FAMILIAR WITH THE USE OF YOUR TELEX/TWX MACHINE.

1. APPROXIMATELY HOW MANY TELEX/TWX MESSAGES DOES YOUR STATION  
SEND \_\_\_\_\_ RECEIVE \_\_\_\_\_ (DAILY ( ) WEEKLY ( ) MONTHLY ( ))
2. ARE MOST OF THESE MESSAGES WITHIN YOUR OWN COMPANY \_\_\_\_\_  
OR TO OUTSIDE COMPANIES \_\_\_\_\_ % INSIDE \_\_\_\_\_ % OUTSIDE \_\_\_\_\_
3. ARE MOST OF THE MESSAGES WITHIN THE US OR TO FOREIGN COUNTRIES  
US % \_\_\_\_\_ FOREIGN % \_\_\_\_\_
4. WHAT IS THE AVERAGE LENGTH OF YOUR MESSAGES \_\_\_\_\_ (EST OF LINES)
5. WHAT IS THE BASIC USE OR APPLICATION FOR YOUR TELEX/TWX  
\_\_\_\_\_
6. APPROXIMATELY HOW MANY OTHER TELEX OR TWX STATIONS DOES YOUR  
COMPANY HAVE INSTALLED IN THE US \_\_\_\_\_
7. DO YOU USE YOUR TELEX/TWX FOR ANY OTHER PURPOSES OTHER THAN MESSAGE  
TRAFFIC, AND IF SO, WHAT USES \_\_\_\_\_
8. IS THIS LOCATION YOUR COMPANY HEADQUARTERS?  
HEADQUARTERS LOCATION \_\_\_\_\_
9. NAME OF INDIVIDUAL IN CHARGE OF COMMUNICATIONS AND TITLE  
\_\_\_\_\_

TEL. NO. \_\_\_\_\_

INPUT has been retained by a large firm in the information industry to examine for them the marketing prospects for a new message telecommunications service which they are considering building. This proposed service, which may be available within a year, will be able to provide many new and useful capabilities to the user of multi station message communications networks.

We have been asked to interview a number of message network users in order to provide user requirement information to our clients service design efforts. Your responses will be held confidential and will not be attributable to your company. Your responses will be part of a summary of user requirements.

1. How many Telex/TWX stations are installed within your company nationwide?
  
  
  
  
  
  
2. Could you provide us with a system map or list of communications locations?
  
  
  
  
  
  
3. What are the business functions performed at these locations; sales offices, warehouses, manufacturing plants, etc.
  
  
  
  
  
  
4. What are the major applications for which the Telex/TWX terminals are used?
  
  
  
  
  
  
5. What is the typical traffic volume for each application?
  
  
  
  
  
  
6. What is the traffic pattern for each application, e.g. sales office to order department and billing department.

7. Do these Telex/TWX stations send or receive much traffic outside of your company?
8. How much?
9. What are the primary applications for this outside traffic?
10. What is the relationship of these outside correspondents to your company?  
(e.g. customers, distributors, vendors)
11. Does your company have other message networks?
12. Describe this other message system(s).
13. System map or list of stations.
14. Why are some stations on Telex/TWX and some on these other networks?
15. Does your company have other data-com networks?
16. Describe this data-com network.

17. System map or list of stations.
18. Are there any interfaces between the Telex/TWX network and these other message and data networks?
19. Is this present interface situation satisfactory?
20. Why or why not?
21. Does your Telex/TWX network interface with any of your company's DP systems?
22. Describe this DP interface.
23. How is the decision made in your company to implement a new message communications network?
24. Are you satisfied with the performance of your existing Telex/TWX network?
25. Why or why not?
26. I am going to mention a number of aspects of a message network. Please tell me how satisfied you are with your Telex/TWX network in each of these aspects.

<u>WELL SATISIFIED</u>	<u>ADEQUATE</u>	<u>INADEQUATE</u>
------------------------	-----------------	-------------------

Network Reliability	_____	_____	_____
Price	_____	_____	_____
Ease of Use	_____	_____	_____
Network Control	_____	_____	_____
Terminal Availability	_____	_____	_____
Value Added Features	_____	_____	_____

27. Have you made any substantial changes in recent years in your company's message networks? (number of stations, computer connection, higher speed network, etc.)

28. What was the primary motivation for such changes?

29. What has been the overall impact of these changes on your company's use of the Telex/TWX? (growth, applications, locations, terminals)

31. What terminals do you use on the Telex/TWX network?

31. Are these terminals satisfactory?

33. What improvements would you like to see in the terminals?

34. From whom do you obtain your Telex/TWX terminals?

35. Would you be interested or willing to obtain terminals from other vendors?

36. Approximately what is the total cost of your company's Telex/TWX network including usage, access and terminal charges?

37. If you use other message networks, what is the total cost of these networks?

38. Are the user departments charged for the use of the Telex/TWX network?

39. Are the user departments charged for the use of the other message networks?

40. How?

41. What type of price structure of a message service would best meet your company's requirements? (fixed, usage sensitive, combination)

42. I am going to mention a number of network management tasks. Tell me how your company handles each of these in terms of who identifies the problem and who expedites the solution.

Station Outage \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Invoice Reconciliation \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

New Station Installations \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

New Application Start-Ups \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Network Optimization (traffic analysis, equipment upgrades) \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

43. Do you or your management regard the handling of these network management tasks as a problem?

44. What would you like to see from vendors with respect to the network management tasks?

45. What is the elapsed time between the origination of a Telex/TWX message and its delivery to the ultimate destination?

46. Would faster delivery be desirable? Why?

47. With how many other stations does a typical Telex/TWX station communicate on a regular basis.

48. What fraction of Telex/TWX messages are delivered to more than one addressee?

49. I am going to mention some value added features which could be useful to a message communications network. Tell me how useful you believe each of these features could be to your present Telex/TWX applications.

	<u>VERY USEFUL</u>	<u>USEFUL</u>	<u>NOT USEFUL</u>
--	--------------------	---------------	-------------------

Abbreviated Dialing	_____	_____	_____
Camp-on	_____	_____	_____
Multiple Address	_____	_____	_____
Group Codes	_____	_____	_____
Station Pulling	_____	_____	_____
Mailbox Delivery	_____	_____	_____

Auto. Service Upgrade	_____	_____	_____
High Speed Interface	_____	_____	_____
Other Service Interface	_____	_____	_____
T & C Call Billing	_____	_____	_____
Departmental Billing	_____	_____	_____
Message Formatting	_____	_____	_____

50. Of the value added features which you believed to be very useful how much more would you be willing to pay to obtain such features? Please express as either \$/message or % additional.

51. Our client is considering the introduction of a new message communications service which would incorporate many of the value added features mentioned as well as being competitively priced with Telex/TWX. Would your company be interested in converting to such a service?

52. What would be your primary motivation for making such a conversion?

53. How important are the following considerations in your decision to convert or not convert to such a service?

	<u>VERY IMPORTANT</u>	<u>IMPORTANT</u>	<u>NOT IMPORTANT</u>
--	-----------------------	------------------	----------------------

Price	_____	_____	_____
Ease of Use	_____	_____	_____
Network Reliability	_____	_____	_____
Network Management	_____	_____	_____
Value Added Features	_____	_____	_____
Geographic Coverage	_____	_____	_____

54. Would you convert your existing private message network to such a service?

55. What would be your primary motivation for making such a change in your private network?
